	S0/0/0			N/A
R2	Fa0/0			N/A
	S0/0/0			N/A
PC1	NIC			
PC2	NIC			

Learning Objectives

Upon completion of this lab, you will be able to:

- Subnet an address space given requirements.
- Assign appropriate addresses to interfaces and documents.
- Configure and activate Serial and FastEthernet interfaces.
- Test and verify configurations.
- Reflect upon and document the network implementation.

Scenario

In this lab activity, you will design and apply an IP addressing scheme for the topology shown in the Topology Diagram. You will be given one address block that you must subnet to provide a logical addressing scheme for the network. The routers will then be ready for interface address configuration according to your IP addressing scheme. When the configuration is complete, verify that the network is working properly.

Task 1: Subnet the Address Space.

Step 1: Examine the network requirements.

You have been given the 192.168.1.0/24 address space to use in your network design. The network consists of the following segments:

- The network connected to router R1 will require enough IP addresses to support 15 hosts.
- The network connected to router R2 will require enough IP addresses to support 30 hosts.
- The link between router R1 and router R2 will require IP addresses at each end of the link.

Step 2: Consider the following questions when creating your network design.

1. How many subnets are needed for this network?

Ans. For this network, three subnets are needed for particularly:

- i) network connected to router R1
- ii) network connected to router R2
- iii) link between router R1 and router R2

2. What is the subnet mask for this network in dotted decimal format?

Ans. The given address block is 192.168.1.0/24

To convert in dotted decimal format, first convert it into a binary subnet mask.

Network in binary: 11000000.10101000.00000001.00000000

Subnet mask: 11111111.11111111.11111111.00000000

We need three subnets so we borrow two bits from the host portion as $2^2 \geq 3$.

So, the subnet mask becomes: 11111111.11111111.11111111.11000000

i.e. 255.255.255.192

3. What is the subnet mask for the network in slash format?

Ans. The subnet mask for the network in slash format is the number of ones in the subnet mask written in dot separated format

Hence, subnet mask for the network in slash format is /26

4. How many usable hosts are there per subnet?

Ans. In IPv4, there are two IPs that cannot be assigned to any devices. These are the Network ID and the Broadcast IP address. Therefore, you need to subtract two addresses from the total IP formula.

Hence, the number of usable hosts is given as $2^H - 2$

where H is host bits (no. of 0s in binary subnet mask)

Therefore $2^6 - 2 = 62$ usable hosts per subnet.

Step 3: Assign subnetwork addresses to the Topology Diagram.

1. Assign subnet 1 to the network attached to R1.

Ans. Subnet 1: 11000000.10101000.00000001.00000000 = 192.168.1.0

2. Assign subnet 2 to the link between R1 and R2.

Ans. Subnet 2: 11000000.10101000.00000001.00100000 = 192.168.1.32

3. Assign subnet 3 to the network attached to R2.

Ans. Subnet 3: 11000000.10101000.00000001.01000000 = 192.168.1.64

Task 2: Determine Interface Addresses.

Step 1: Assign appropriate addresses to the device interfaces.

1. Assign the first valid host address in subnet 1 to the LAN interface on R1.

Ans: 192.168.1.1

2. Assign the last valid host address in subnet 1 to PC1.

Ans: 192.168.1.30

3. Assign the first valid host address in subnet 2 to the WAN interface on R1.

Ans: 192.168.1.33

4. Assign the last valid host address in subnet 2 to the WAN interface on R2.

Ans: 192.168.1.62

5. Assign the first valid host address in subnet 3 to the LAN interface of R2.

Ans: 192.168.1.65

6. Assign the last valid host address in subnet 3 to PC2.

Ans: 192.168.1.94

Step 2: Document the addresses to be used in the table provided under the Topology Diagram

Device	Interface	IP Address	Subnet Mask	Default Gateway
R1	Fa0/0	192.168.1.1	255.255.255.224	N/A
	S0/0/0	192.168.1.33	255.255.255.224	N/A
R2	Fa0/0	192.168.1.65	255.255.255.224	N/A
	S0/0/0	192.168.1.62	255.255.255.224	N/A
PC1	NIC	192.168.1.30	255.255.255.224	192.168.1.1
PC2	NIC	192.168.1.94	255.255.255.224	192.168.1.65

Task 3: Configure the Serial and FastEthernet Addresses.

Step 1: Configure the router interfaces.

Configure the interfaces on the R1 and R2 routers with the IP addresses from your network design. Please note, to complete the activity in Packet Tracer you will be using the Config Tab. When you have finished, be sure to save the running configuration to the NVRAM of the router.

Step 2: Configure the PC interfaces.

Configure the Ethernet interfaces of PC1 and PC2 with the IP addresses and default gateways from your network design.

Router2#

```

We can see that the routers in our network only have the addresses of devices which are directly connected to its interfaces in their routing table. Hence static or dynamic routing is not present. Therefore, over here we cannot ping devices on another subnet.

Conclusion: From this experiment, I understood the subnetting and the router configurations of various networks.
